THE POLITICAL COMPETENCE OF REPRESENTATIVES IN LATIN AMERICA: AN ANALYSIS OF ELEVEN NATIONAL CASES

Manuel Alcántara

**Introduction**

Studies on politicians’ careers have a long history and a central place in Political Science. Some show the possibility of analysing a politician from the perspective of the individual, cultural, social and institutional mechanisms that take him to power and help him stay there. Others explain the effect of one type of political personality or other on the political process itself. Both currents within this literature refer to several aspects, including psychological features (where ambition is particularly important) and other characteristics that together form a list of competences that are more or less essential for any politician. The aim of this paper is to focus on this second group of aspects and undertake an analysis of political competence for a group of 11 countries in Latin America which are different in size and political development, in terms of the quality of democracy. The empirical investigation is based on the replies of a selection of Representatives from the last legislatures in these countries. As in this study we do not consider psychological explanations, first of all we shall explain the pertinence of the use of the term “competence” rather than “professionalization” or “quality”. We continue by defining an index of political competence. To conclude we aim to relate this competence with the quality of democracy, following a concept measured by different authors.

**Competence versus professionalization and quality**

Studies on the role of politicians vary from analyses that underline their professionalization to investigations on the quality of their actions. In the case of the former, Weber (1967: 95) established that the professionalization of politics depends on two inter-related situations that combined living “for” politics and living “from” politics. For his part, Sartori (1992: 180) supported a definition of a professional politician in a strict sense as one that simply did not have another profession. In other works, politicians have been analysed, more specifically, from the point of view of their work as candidates (Poutvaara y Takalo, 2004), as candidates promoted by interest

---

1 Please note that it is a very preliminary version of the final work. I am grateful to Cristina Rivas for the statistical treatment of the data and to Claire Wright for the translation of the text.
2 For a review of the literature on this topic, see Martínez-Rosón (2008b).
3 See PELA (1994-2008).
4 The following indexes are used: IDD-Polilat (the Konrad Adenauer Foundation), The Economist Intelligence Unit (EIU) and the index of Levine y Molina (2007)
groups (Wittman, 2005) or as parliamentarians (Martínez-Rosón, 2008a). According to the replies from Latin American Representatives, very few dedicate themselves exclusively to politics therefore the professionalization of the political class considered here is rather different from Sartori’s ideal.

In terms of the quality of Representatives’ actions, Weber himself (1967: 153) highlighted the key qualities for any politician. He referred to passion (in terms of a passionate commitment to a cause), a sense or responsibility, and control (a capacity to keep a distance from people and events). More recently, competence and honesty have been established as two dimensions of quality (Caselli y Morelli, 2000). Clearly, passion, control and honesty are difficult factors to measure and imply a high level of subjectivity, which means that they are not particularly useful for the purpose of comparison. For example, honesty is linked to fulfilling standards with an ethical component in the social environment in which the politician works - something that can change quite substantially from one country to another. The “ambition” component presents similar difficulties (Martínez Rosón, 2008b).

On the other hand, quality is generally related to a politician’s ability to satisfy the expectations of a determined group, whether it is the population in general, the political class itself or specialist external observers. This leads us to the question of the definition of expectations and how to measure to what extent they are met.

The term “competence” is defended in this paper and is a result of elements that together make up the skills that are needed to carry out political tasks⁵. It is rather different from the vision of Caselli and Morelli (2000), which associates competence with the search for an optimum balance between offering vital public goods and a minimum level of fiscal income. In this sense, the PELA study helps us to elaborate an index that captures this concept, based on Representatives’ replies to the questionnaire. Two components that make up the series of skills necessary for a Latin American politician to carry out his role are his level of education and the *cursus honorum* of his political career.

---

⁵ In this sense it is near to the idea defended by Martínez Rosón (2008a:236), according to which quality is the group of personal skills that dive the legislator the necessary competence to carry out his or her obligations.
The political competence index

The political competence index used in this paper is measured on a scale from 0 to 100, where 0 is minimum competence in political leadership and 100 is maximum competence. The index is made up of two factors: education and political career. Each factor has been given a different weight bearing in mind that they affect a person’s political competence in different ways. For this reason, greater value is given to a the parliamentarian’s experience or political career than his education (given that the education level of the Representatives in the eleven countries analysed here is in the vast majority of cases university studies, which means that we could not establish considerable differences between countries.) The variable that constitutes the education factor is the Representative’s level of studies and accounts for 35% of the total weight of the index. For its part, the political career factor accounts for the remaining 65%. This factor is made up of five variables: parliamentary experience (measured by the number of times that a Representative has been elected), the number of years in politics, experience in popular representation, experience in appointed posts and party experience. Experience in roles of popular representation, appointed posts and party experience are made up of two variables: the number of roles carried out and the importance of these roles. These five variables are given the same importance and therefore each one of them represents 13% of the total weight assigned to the political career factor (65%)7.

6 The years of militancy in a political party have been grouped into thirteen categories: between 0 and 5 years; 6 and 10 years; 11 and 15 years; 16 and 20 years; 21 and 25 years; 26 and 30 years; 31 and 35 years; 36 and 40 years; 41 and 45 years; 46 and 50 years; 51 and 55 years; 56 and 60 years; 61 and 65 years and over 66 years.

7 In the case of Costa Rica, the “political career” factor is calculated with four variables as in this country it is not possible for Representatives to be re-elected.
Table 2 establishes five groups according to the Representatives’ level of political competence (0-20: very low quality; 20-40: low quality; 40-60: medium quality; 60-80: high quality; 80-100: very high quality). However, in later analyses we join the categories of low and very low on one hand and high and very high on the other hand (in fact no individual fits in the “very high” group). In this way, three groups are formed, which are more efficient for carrying out further analyses due to the greater number of cases in each category (Table 3).

* Recodification of the political competence index from 0 to 100 into five groups: (0-20: very low quality; 20-40: low quality; 40-60: medium quality; 60-80: high quality; 80-100: very high quality)

A priori, it is easy to presume that a Representative’s age is closely linked to his or her experience and number of years in politics. The eleven countries analysed here support this hypothesis: there is a significant relationship between a Representative’s age and
his level of political competence\textsuperscript{8}. Therefore, it can be said that the older a Representative is, the more politically competent he is. Table 4 shows political competence index by age groups.

TABLE 4: Distribution of Representatives by political competence and age (%).

Education and political career as separate aspects of political competence

In this section we analyse two factors that make up the political competence index. To do this, we calculate an education index and a political career index, both on a scale from 1 to 100.

The education index consists of the Representative’s level of studies.

For its part, the political career index is formed by five variables: parliamentary experience; the number of years in politics\textsuperscript{9}; experience in popular representation and the importance of the posts carried out; experience in appointed posts and their importance; and party experience together with the importance of the tasks carried out. These five variables that make up political career are of equal importance and therefore will all have the same weight in the index, that is to say 20% of the total\textsuperscript{10}.

TABLE 5: Education and political career indexes by country (averages) (Scale from 0 to 100).

<table>
<thead>

<td>83.61</td>
<td>23.64</td>
</tr>
<tr>
<td>-Colombia</td>
<td>87.62</td>
<td>16.52</td>
</tr>
</tbody>
</table>

\textsuperscript{8} The coefficient or correlation between these two variables is 0.222 and is significant with a confidence level of 0.01.

\textsuperscript{9} The years of militancy in a political party have been grouped into thirteen categories: between 0 and 5 years; 6 and 10 years; 11 and 15 years; 16 and 20 years; 21 and 25 years; 26 and 30 years; 31 and 35 years; 36 and 40 years; 41 and 45 years; 46 and 50 years; 51 and 55 years; 56 and 60 years; 61 and 65 years; and over 66 years.

\textsuperscript{10} In the case of Costa Rica, the “political career” factor is calculated with four variables as in this country it is not possible for Representatives to be re-elected.

* Re-codification of the index of political career from 0 to 100 in five groups: (0-20: very low quality; 20-40: low quality; 40-60: medium quality; 60-80: high quality; 80-100: very high quality)

In this case, there is also a significant correlation between age and political career. Furthermore, it can be said that the older a Representative is, the longer his political career will be. However, there is no relationship between a deputy’s age and his level of education.

11 The coefficient of correlation is 0.366 and is significant with a confidence level of 0.01.
In any case, there does seem to be a correlation – albeit a very weak one – between a Representative’s level of education and political career, with a coefficient of 0.081 and a confidence level of 0.05. Therefore, it could be said that those individuals with greater education also have greater political experience.
